Key Insights:

1. High Volume of Ratings

- Total Rating Count: Over 26 million, indicating strong customer engagement and transaction volume.
- Popular Categories: Categories like Electronics, Home & Kitchen, and Computers & Accessories dominate in terms of rating count and review activity.

2. Top Discounted Category

- Average Discount: ~698.68, which is quite significant.
- High Discounts are mainly associated with Computer Accessories and Electronics, possibly to stimulate sales in competitive segments.

3. Customer Feedback Patterns

- Reviews like “Good product,” “Cost-effective,” and “Easy to use” are commonly associated with high-rated items in categories like Home & Kitchen and Electronics.
- Negative phrases like “Not much durable” or “It's not working” appear in lower-performing clusters, hinting at quality concerns in some product lines.

4. Product Pricing vs Rating

- Items priced between ₹499 and ₹1999 receive the highest ratings, suggesting a price sweet spot where perceived value aligns with expectations.

5. Rating vs Discount Relationship

- Higher discounts don't always correlate with better ratings. Some categories receive big discounts yet don't stand out in rating totals.

6. Category Concentration

- A few product categories dominate both in ratings and discount distribution, indicating a potential over-reliance on limited verticals.

Business Decisions & Recommendations:

- ✓ 1. Double Down on High-Performing Categories
 - Focus marketing and inventory investments on Electronics, Home & Kitchen, and Computers & Accessories as they show strong engagement and customer satisfaction.
- ✓ 2. Optimize Discount Strategy
 - Analyze ROI on discounts: While discounts are high, ensure they are driving conversions. Consider A/B testing lower discounts in certain segments to optimize profitability without sacrificing volume.
- ✓ 3. Leverage Positive Review Themes in Marketing
 - Use real user feedback (e.g., "Easy to use", "Cost effective") in promotional campaigns and product descriptions to increase trust and click-through rates.
- ✓ 4. Investigate Low-Rated Feedback
 - Perform a sentiment analysis on negative review clusters to identify frequent issues (e.g., durability, functionality), then work with suppliers or internal teams to address product defects or misleading listings.
- ✓ 5. Bundle and Promote Mid-Price Products
 - Products in the ₹499–₹1999 range perform well — these should be the target for bundling, upselling, and flash sales.
- ✓ 6. Diversify Product Portfolio
 - Reduce dependency on a few categories by exploring adjacent ones that show early traction but have low review counts — possibly due to under-marketing.
- ✓ 7. Data Quality
 - Some product names and category fields are poorly formatted (e.g., long concatenated strings). Clean data presentation can improve user interface and decision clarity for internal dashboards.
